

MEDICAL VALVE WITH POSITIVE FLOW CHARACTERISTICS

Abstract of the Disclosure

5 A medical valve device for use in selectively establishing a fluid flow between
first and second medical implements is disclosed. The valve has a body defining a
passage from a first port to a second port. The valve defines a first fluid volume
when both medical implements are connected thereto, and a second, smaller volume
when one of the implements is disconnected, thereby causing a positive flow of fluid
10 from the valve to the second medical implement when the first implement is
disconnected.
